

Cloud Infrastructure & Deployment Plan

AI-generated document - not legal advice. Review with a licensed professional before signing.

Infrastructure Overview

Establish a scalable, highly available cloud environment using AWS or GCP to host the platform's core services.

Deployment Pipelines

Implement robust CI/CD pipelines using GitHub Actions or GitLab CI to automate testing, building, and deployment of microservices.

Infrastructure as Code (IaC)

Use Terraform or Pulumi to manage and version cloud resources, ensuring reproducible environments across staging and production.

Monitoring & Observability

Deploy Prometheus and Grafana for real-time metrics, and use ELK stack (Elasticsearch, Logstash, Kibana) for centralized logging.
